

Note: When the 31st (or later) Full host is added to the list displayed in the Hosts box and OK is clicked, a warning window appears, informing you that the system may not recognize more than 30 full hosts. This limitation is based upon your local machine's capabilities. If your machine is capable of supporting additional hosts, then clicking SAVE ANYWAY in the warning window saves the additional host(s) and dismisses the warning window. If your machine is not capable of supporting the additional host(s), clicking FIX IT NOW returns you to the SysCon window, where you may modify the host listing to comply with the machine limitation.

When all necessary hosts have been defined in the Hosts box, you must define which hosts serve specific network/server functions on the LAN.

To assign specific host roles:

1. Verify the hostname in the Local Hostname: field. This should be your workstation's hostname.
2. In the TDBM Master: field, enter the TDBM Server hostname for your workstation.
3. Enter the appropriate hostname in the following fields:

admin	qs
prt	wdbm

Note: Typically, in the GCCS environment, both the TDBM server and TDBM clients should have the TDBM server hostname in each of the above fields. However, to account for diverse configuration capabilities, any hostname may be entered in these fields.

4. Click OK to save the changes you have made to this portion of the window and dismiss the SysCon window.
